XX
CC This sequence represents the heavy chain variable region of murine
CC monoclonal antibody LM609. LM609 is directed to integrin
CC alpha-v beta-3. It selectively promotes apoptosis of vascular
CC cells that have been stimulated to undergo angiogenesis, making it
CC a tool for cancer diagnosis and therapy. The invention provides
CC humanised antibodies, especially humanised LM609. In such humanized
CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
CC grafted onto a human light chain, and a heavy chain CDR from a mouse
CC antibody is grafted onto a human antibody heavy chain to produce
CC libraries from which a humanised murine antibody having the desired
CC specificity is selected. By preserving the original CDR sequences
CC such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the
CC humanisation strategy ensures epitope conservation.

 XX
 XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
 PT integrin - and related grafted antibodies based on murine monoclonal
 PT LM609, also related nucleic acid, used to treat, prevent or diagnose
 PT angiogenesis or restenosis
 XX
 PS Claim 1; Fig 1a; 129pp; English.
 XX
 CC This sequence represents a fragment of the vitaxin antibody variable
 CC heavy chain region. Vitaxin and the antibody LM609 bind selectively to
 CC integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3
 CC to a ligand and thus block integrin-mediated signal transduction. This is
 CC useful in the treatment, prevention and diagnosis of alphavbeta3-mediated
 CC disease, specifically angiogenesis and restenosis (but also e.g.
 CC (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma,
 CC cancer, psoriasis, rheumatoid arthritis, macular degeneration,
 CC osteoporosis etc.). The antibodies contain non-murine framework regions
 CC so are suitable for use in humans. Enhanced types of LM609 have affinity
 CC more than 90 times greater than that of parent the parent antibody.

 XX New LM609 grafted antibody exhibiting selective binding affinity to
 PT alphavbeta3, comprising at least one LM609 grafted heavy and light
 PT chain polypeptide, useful for diagnosing and treating e.g. inflammatory
 PT disorders or cancer
 XX
 PS Claim 1; Fig 1A; 25pp; English.
 XX
 CC The present sequence represents the heavy chain variable region of the
 CC grafted monoclonal antibody LM609. LM609 is a murine antibody which
 CC specifically recognises the integrin alphavbeta3, and inhibits its
 CC functional activity. The LM609 grafted antibody has the
 CC complementarity determining regions (CDRs) substituted into a non-murine
 CC framework. Nucleic acids encoding LM609 grafted heavy and light chain
 CC polypeptides and fragments are useful in diagnostic and therapeutic
 CC purposes, such as in the production of LM609 grafted antibodies and
 CC fragments having binding specificity and inhibitory activity against
 CC the integrin alphavbeta3. The antibody can be used for the diagnosis
 CC or treatment of alphavbeta3-mediated diseases (e.g. inflammatory
 CC disorders, chronic articular rheumatism, psoriasis, disorders
 CC associated with inappropriate or inopportune invasion of vessels such
 CC as diabetic retinopathy, neovascular glaucoma and capillary
 CC proliferation in atherosclerotic plaques, or cancers), and to inhibit
 CC binding activity of alphavbeta3 that are necessary for progression of
 CC an alphavbeta3-mediated disease.

XX XX
XX PS Example 26; Page 61; 109pp; English.
XX CC
XX CC An initial isolation of cDNAs coding for murine anti-human breast
XX CC carcinoma MAb KC-4 was performed using PCR with commercially
XX CC available primers (see AAQ62776-Q62783, available from NOVAGEN).
XX CC Subsequent cloning using PCR primers JO20, JO21, JO22 and JO24
XX CC (see AAQ62784-Q62787) resulted in the isolation of the mouse Ig
XX CC variable domains. The amplified cDNAs were sequenced (AAQ62788 and
XX CC AAQ62789) and amino acid sequences were deduced from them. Chimeric
XX CC mouse-human antibodies were constructed using human constant
XX CC regions so as to produce less immunogenic polypeptides which
XX CC retained the anti-human carcinoma binding specificity of KC-4.

XX XX
XX PT Treatment of colorectal or gastric carcinoma - using radio-labelled
XX PT monoclonal antibody or fragment which binds to antigen A33
XX XX
XX PS Example 8; Fig 5B; 59pp; English.
XX CC
XX CC The present sequence represents a murine monoclonal antibody A33 (mA33)
XX CC heavy chain variable domain. The light chain variable domain of mA33
XX CC is shown in AAW48863. These sequences were used to construct a chimeric
XX CC humanized antibody A33 (hA33; see AAW48864 and AAW48866). The invention
XX CC claims to provide a method for causing regression of a colorectal
XX CC carcinoma or a gastric carcinoma by administering the radio-labelled
XX CC chimeric hA33 or a radio-labelled binding fragment of hA33 to the
XX CC patient.

 XX
 XX Reducing immunogenicity of proteins - by modifying the amino acid
 PT sequence of the protein to eliminate potential epitopes for T-cells
 PT of a given species
 XX
 XX Example 6; Fig 26; 77pp; English.
 PS
 XX The invention relates to a method for the production of non-immunogenic
 CC proteins. The method comprises determining at least part of the amino
 CC acid sequence of the protein; (b) identifying in the amino acid sequence
 CC one or more potential epitopes for T-cells (T-cell epitopes) of the given
 CC species; and (c) modifying the amino acid sequence to eliminate at least
 CC one of the T-cell epitopes identified in step (b) thereby to eliminate or
 CC reduce the immunogenicity of the protein when exposed to the immune
 CC system of the given species. A method of analysing a pre-existing protein
 CC to predict the basis for immunogenic responses is also provided. The
 CC methods can be used particularly for reducing the immunogenicity of
 CC immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The
 CC products can be used for diagnosis and therapy. The present sequence
 CC represents the protein sequence of murine A33 Vh.

 XX Humanised antibodies raised against A33 antigen - are used for
 PT diagnosis or treatment of colorectal tumours and metastases
 PT
 XX Example 1; Fig 3(ii); 90pp; English.
 PS
 XX The sequences given in AAR56961-62 represent the light and heavy chain
 CC variable regions (VH and VL) of the humanised anti-A33 antibody of the
 CC invention. The DNA fragments encoding these proteins were produced by
 CC PCR using the primer sequences given in AAO68624-48. The amplified
 CC fragments were used in the construction of vectors for the expression
 CC and secretion of the chimeric humanised A33. The amplified products
 CC were cleaved with BstBI and SphI for the light chain and HindIII and
 CC ApaI for the heavy chain. These fragments were cloned into the human
 CC kappa light chain acceptor vector, pMRR15.1, and the human heavy chain,
 CC IgG1, acceptor vector, pMRR011 respectively, to give chimeric expression
 CC vector pRO108 for the light chain and pRO107 for the heavy chain.
 CC Proteins which bind the A33 antigen can be used in the diagnosis or
 CC treatment of colorectal cancers and metastases.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX PT Producing humanized immunoglobulin, involves producing a cell

PT containing DNA segments encoding humanized heavy and light chain

PT variable regions, and expressing the DNA segments in the cell -

XX Example 8; Fig 39; 145pp; English.

XX The present invention describes a method of producing humanised

CC immunoglobulins involving expressing in a cell a nucleic acid encoding a

CC humanised version of an immunoglobulin. This is obtained by comparing a

CC donor and human immunoglobulin and producing a combined antibody which

CC contains part of each. These are useful in the treatment of

CC graft-versus-host disease, transplant rejection, autoimmune diseases such

CC as diabetes, rheumatoid arthritis, myasthenia gravis, multiple sclerosis

CC and systemic lupus erythematosus, herpes infections, CMV virus infections

CC and myeloid leukaemia. The present sequence is an antibody used to

CC demonstrate the method of the invention.

PT	therapeutic efficiency by presenting human surface on V-region	
XX		
PS	Example 1; Fig 3A; 230pp; English.	
XX		
CC	The present sequence is that of the light chain variable (LC VR) region	
CC	of murine antibody 3Hfm. This sequence was aligned with 11 other known	
CC	antibody LC VRs and a set of framework positions of surface exposed amino	
CC	acid residues was determined. This information can be used in a method to	
CC	determine how to modify a rodent antibody or fragment by resurfacing in	
CC	order to produce a humanised rodent antibody. Residues (determined from	
CC	alignment) at positions 1, 3, 5, 9, 15, 18, 46, 47, 51, 63, 66, 73, 86,	
CC	87, 111, 115, 116 and 117 are accessible residues. None of the entire	
CC	combinations of surface residues in the murine sequences were found in	
CC	the human sequences and vice versa. However the residues in individual	
CC	positions appear to be conserved.

XX The amino acid sequences of the light and heavy chains of the
CC variable domains from antibodies HYH (HYHEL-10 Fab-lysosome complex)
CC (AAR38601 and AAR38608, respectively), MCPC (IgA Fab
CC MCPC603-phosphocholine complex) (AAR38602-03 and AAR38609-10,
CC respectively), NEWM [Ig Fab' NEW] (AAR38604-05 and AAR38611,
CC respectively) and KOL [IgG1 KOL] (AAR38606-07 and AAR38612, respectively)
CC may be used to determine an alignment from which appropriate changes may
CC be made. Unlike other methods of humanisation, which advocate the
CC replacement of entire antibody framework regions with those of human
CC antibodies, this method involves only the introduction of human
CC residues into those positions not critical for antigen binding.
CC This ensures that the binding properties of the modified antibody
CC are not diminished.

 PT Depletion of CD5-positive cells in vivo - using anti-CD5 antibodies
 PT with humanised variable regions
 XX
 XX Disclosure; Column 43-44; 77pp; English.
 XX
 CC A method has been developed of depleting CD5+ cells in an animal. The
 CC method comprises administering a cytotoxic protein containing a modified
 CC immunoglobulin (Ig) variable domain, where the protein is an anti-CD5 Ig
 CC molecule or an immunconjugate or fusion protein containing an anti-CD5
 CC Ig molecule, and where the modified Ig variable domain comprises at
 CC least one of (a) a modified light chain variable region (see AAW58478 or
 CC AAW58480), and (b) a modified heavy chain variable region (see AAW58479
 CC or AAW58481), where AAW58478 and AAW58479 are humanised forms of the H65
 CC light and heavy chain variable domains with low risk amino acid
 CC substitutions [i.e. low risk of reducing antigen-binding specificity.]
 CC and AAW58480 and AAW58481 are humanised forms of the H65 light and heavy
 CC chain variable domains with moderate risk amino acid substitutions and
 CC are present in humanised H65 antibody he3 (ATCC HB 11206). The method is
 CC useful for treating autoimmune diseases, especially systemic lupus
 CC erythematosus, rheumatoid arthritis, psoriasis or type I diabetes. The
 CC present sequence represents the murine HVH antibody light chain variable
 CC domain.

 XX
 PS Example 13; Page 59-60; 97pp; English.
 XX
 CC This is the amino acid sequence of the light chain variable region
 CC (VL) of the anti-human alpha_v beta_3 vitronectin receptor murine
 CC monoclonal antibody D12, as deduced from isolated cDNA (see
 CC AAV71798). D12 VH (see AAW84093) and VL show sequence similarity to
 CC Kabat VH subgroup I (see AAW84093) and Kabat VK subgroup III (see
 CC AAW84096), respectively. Humanised VH (see AAW84097) and VL (see
 CC AAW84098) were constructed by combining the framework regions of the
 CC human V region consensus sequences with complementarity determining
 CC regions of D12 (keeping some preferred murine framework residues).
 CC The humanised antibodies are specifically reactive with the human
 CC alpha_v beta_3 protein receptor and capable of neutralising the
 CC receptor. They can be used for passive immunotherapy of a disorder
 CC mediated by the alpha_v beta_3 receptor, e.g. cardiovascular
 CC disorders or angiogenic-related disorders, such as angiogenesis
 CC associated with diabetic retinopathy, atherosclerosis and
 CC restenosis, chronic inflammatory disorders, macular degeneration,
 CC rheumatoid arthritis and cancer, e.g. solid tumour metastasis, and
 CC diseases where bone resorption is associated with pathology such as
 CC osteoporosis, hyperparathyroidism, Paget's disease, hypercalcaemia
 CC of malignancy, osteolytic lesions produced by bone metastasis, bone
 CC loss due to immobilisation or sex hormone deficiency. They can also
 CC be used for targeted drug therapy, and for detection and diagnosis.

XX Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
PS Claim 60; Page 41; 129pp; English.
XX
XX AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

PS
XX The present invention relates to enhanced LM609 grafted antibodies
CC exhibiting selective binding affinity to alphavbeta3 integrin or
CC their functional fragments. The antibodies or their functional
CC fragments can be used in the diagnosis and treatment of
CC alphavbet&3-mediated diseases such as angiogenesis, inflammatory

CC diseases (such as psoriasis and chronic articular rheumatism),
CC disorders associated with inappropriate or inopportune invasion of
CC vessels (such as diabetic retinopathy, neovascular glaucoma and
CC cancer disorders such as tumours and Kaposi's sarcoma), retinal
CC diseases (such as macular degeneration), restenosis and
CC osteoporosis.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX Disclosure; Page 40; 129pp; English.
PS
XX AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX Reducing immunogenicity of proteins - by modifying the amino acid
PT sequence of the protein to eliminate potential epitopes for T-cells
PT of a given species
XX
PS Example 5; Fig 25; 77pp; English.
XX
CC The invention relates to a method for the production of non-immunogenic
CC proteins. The method comprises determining at least part of the amino
CC acid sequence of the protein; (b) identifying in the amino acid sequence
CC one or more potential epitopes for T-cells (T-cell epitopes) of the given
CC species; and (c) modifying the amino acid sequence to eliminate at least
CC one of the T-cell epitopes identified in step (b) thereby to eliminate or
CC reduce the immunogenicity of the protein when exposed to the immune
CC system of the given species. A method of analysing a pre-existing protein
CC to predict the basis for immunogenic responses is also provided. The
CC methods can be used particularly for reducing the immunogenicity of
CC immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The
CC products can be used for diagnosis and therapy. The present sequence
CC represents the protein sequence of de-immunised humanised A33 Vh.

XX Agent contg. antigen-binding domain of human antibody to

PT transforming growth factor beta 1 or 2 - and nucleic acid encoding
PT it, used to neutralise effects of TGF, e.g. for control of fibrosis,
PT immune and inflammatory disease
XX
PS Claim 16; Fig 1c(i); 184pp; English.
XX
CC This polypeptide sequence comprises the VH domain of human scFv
CC antibody 31G9, which is specific for transforming growth factor
CC (TGF) beta-1. It is encoded by a gene (AAR60382) obtained from a
CC CDR3 spiking experiment. The antigen-binding domains of human
CC antibodies (see AAW15522-40) to TGF beta-1 and/or beta-2 can be
CC used to counter the adverse effects of TGF beta, such as (i)
CC promotion of fibrosis (in dermal, ocular or keloid scarring, lung
CC fibrosis, arterial injury, proliferative retinopathy, retinal
CC detachment, adult respiratory distress syndrome, liver cirrhosis,
CC post myocardial infarction, post-angioplasty restenosis,
CC scleroderma, vascular disorders, cataract, glaucoma, or esp. neural
CC scarring and glomerulonephritis, also (not claimed) osteoporosis),
CC or (ii) immune and inflammatory diseases (e.g. rheumatoid
CC arthritis, macrophage deficiency diseases or macrophage pathogen
CC infection). Nucleic acids encoding human antibody VH and VL can be
CC used for prodn. of recombinant antigen-binding domains. These are
CC highly specific, have low dissociation constants (pref. less than 5
CC nM) and low IC50s for neutralisation.

XX Improved method for antibody treatment - uses an antibody comprising
PT an Old World monkey variable region and a human constant domain
XX
XX Example 1; Fig 9c; 84pp; English.
XX
CC This sequence represents the VH3 domain of an anti-CD4 antibody
CC (Ab). This sequence can be used in the method of the invention for
CC treating a subject, where the treatment comprises administration of an
CC Ab. The method comprises the administration of an antibody which has an
CC Old World monkey (e.g. baboon or macaque) variable region which binds to
CC an antigen (Ag) (or Ag binding portion), and a human constant domain. The
CC method is useful for the treatment of eczema and immuno-modulated
CC diseases and especially rheumatoid arthritis. The recombinant antibodies
CC used are sufficiently different from native monkey antibodies to allow
CC human antigens to raise these antibodies, but similar enough to human
CC antibody so there is no immune response to the antibodies in humans.
CC Compared to antibodies used in therapy in prior art, these antibodies do
CC not induce human anti-antibodies on repeated administration. They also
CC have longer half-lives and do not have a lack of effector function with
CC human cells.

XX Antibodies against B Lymphocyte Stimulating polypeptides, useful for
 PT the diagnosis and treatment of cancers and immune disorders -
 XX
 XX
 PS Claim 1: Page 2064-2065; 3148pp; English.
 XX
 CC This invention describes novel antibodies that immunospecifically bind to
 CC B Lymphocyte Stimulator (Blys) polypeptides. Blys is a member of the
 CC tumour necrosis factor (TNF) super family and induces B cell
 CC proliferation and differentiation. The antibodies of the invention have
 CC cytostatic, immunosuppressive, immunostimulant, immunomodulatory,
 CC antirheumatic and antiAIDS activity and can be used in vaccines to
 CC inhibit the expression and activity of Blys. The antibodies bind to Blys
 CC and so may be used to detect and quantitate the presence of Blys in
 CC biological samples and may be used in this way to diagnose disease
 CC associated with aberrant expression of Blys. They may also be
 CC administered to treat diseases associated with aberrant Blys expression
 CC and activity such as cancer, immune, and autoimmune disorders and
 CC diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis,
 CC immunodeficiency (e.g. common variable immunodeficiency (CVID) and
 CC acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent
 CC the antibodies and fragments of the antibodies described in the method
 CC of the invention.

PT Antibodies against B Lymphocyte Stimulating polypeptides, useful for
 PT the diagnosis and treatment of cancers and immune disorders -
 XX
 XX
 PS Claim 1: Page 2924-2925; 3148pp; English.
 XX
 CC This invention describes novel antibodies that immunospecifically bind to
 CC B Lymphocyte Stimulator (Blys) polypeptides. Blys is a member of the
 CC tumour necrosis factor (TNF) super family and induces B cell
 CC proliferation and differentiation. The antibodies of the invention have
 CC cytostatic, immunosuppressive, immunostimulant, immunomodulatory,
 CC antirheumatic and antiAIDS activity and can be used in vaccines to
 CC inhibit the expression and activity of Blys. The antibodies bind to Blys
 CC and so may be used to detect and quantitate the presence of Blys in
 CC biological samples and may be used in this way to diagnose disease
 CC associated with aberrant expression of Blys. They may also be
 CC administered to treat diseases associated with aberrant Blys expression
 CC and activity such as cancer, immune, and autoimmune disorders and
 CC diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis,
 CC immunodeficiency (e.g. common variable immunodeficiency (CVID) and
 CC acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent
 CC the antibodies and fragments of the antibodies described in the method
 CC of the invention.

XX (TAKE ) TAKEDA CHEM IND LTD.
PA Iwasa S, Taka H, Watanabe T, Tada H;
XX WPI: 1992-209528/26.
XX N-FSDB: AAQ25692.
XX Chimeric monoclonal antibodies - contain anti-human fibrin
PT antibody light and heavy chain variable and constant for treating
PT thrombotic conditions e.g. myocardial infarction
XX Example; Figure 11; 87pp; English.
XX Plasmid pTB1373 contains the whole length of a mouse-human
CC chimeric anti-human fibrin heavy chain cDNA open reading
CC frame. It was prepd. using Poly(A)+ RNA from the anti-fibrin
CC chimeric Ab-producing transformant FIB1-H01/X63 as a template
CC to clone human C-kappa cDNA, using the oligo-dT (Pharmacia) primer as
CC a primer for first strand cDNA synthesis and the 5'C2H and 3'EH
CC primers for the PCR. A human gamma-1 chain CH2-CH3 domain encoding
CC cDNA was amplified. Similarly a human gamma-1 chain CH1 domain
CC encoding cDNA and an anti-fibrin antibody VH cDNA and a leader
CC peptide cDNA were amplified using the primers 3'EH, 3'C2H and 3'CLH
CC respectively as a primer for first strand cDNA synthesis and the
CC primer combination of 5'CLH and 3'C2H, of 5'EH and 3'CLH and of
CC 5'GH and 3'EH respectively as primers for PCR. The amplified gene
CC products were isolated and used to produce plasmids. After
CC confirmation of the cDNA sequence of each plasmid, the cDNA
CC encoding LH, VH, CH1 and CH2CH3 were joined together to give
CC plasmid pTB1373 contg. the whole length chimeric H chain
CC (LH, VH, CH1, CH2CH3), also abbreviated as Igh-FIB,

XX New human antibody specific for human interleukin-12 (IL-12) used to
PT treat disorders characterized by aberrant IL-12 expression e.g. Crohn's
PT disease and multiple sclerosis -
XX Claim 75; Page 121; 377pp; English.
XX This invention relates to a new human antibody specific for human
CC interleukin-12 (IL-12). The invention also includes antigen binding
CC portions that bind to IL-12. Sequences AAB39485-B39516 represent human
CC anti-IL-12 antibody heavy and light chain complementarity determining
CC region (CDR) amino acid sequences, and also includes variable region
CC amino acid sequences. Other variable region amino acid sequences are
CC given in AAB39517-B39560 and AAB40068-B40149. Sequences AAB39561-B39771
CC represent anti-IL-12 CDR3 related amino acid sequences. AAB39772-B40063
CC represent other CDR sequences. Light chain CDR3 consensus sequences are
CC given in AAB40064-B40067. Primers used in the identification and
CC construction of the antibodies of the invention are given in
CC AAC61062-C61071. The antibody of the invention is a neutralising
CC antibody and has antirheumatic; antiarthritic; antisclerotic;
CC antiinflammatory; neuroprotective; antipsoriatic; antiasthmatic;
CC cardiant; antiparasitic; antibacterial and immunosuppressive activity.
CC The antibodies or antigen-binding fragments are useful in the treatment
CC of disorders associated with detrimental release of human IL-12,
CC especially Crohn's disease, multiple sclerosis and rheumatoid arthritis.
CC They can also be used in the manufacture of a pharmaceutical composition
CC to treat human IL-12 disorders.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX Claim 60; Page 41; 129pp; English.
XX
XX AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX
XX The present invention relates to enhanced LM609 grafted antibodies
CC exhibiting selective binding affinity to alphavbeta_3 integrin or
CC their functional fragments. The antibodies or their functional
CC fragments can be used in the diagnosis and treatment of
CC alphavbeta_3-mediated diseases such as angiogenesis, inflammatory

CC diseases (such as psoriasis and chronic articular rheumatism),
CC disorders associated with inappropriate or inopportune invasion of
CC vessels (such as diabetic retinopathy, neovascular glaucoma and
CC cancer disorders such as tumours and Kaposi's sarcoma), retinal
CC diseases (such as macular degeneration), restenosis and
CC osteoporosis.

XX PT New LM609 grafted antibody exhibiting selective binding affinity to
XX PT alphavbeta3, comprising at least one LM609 grafted heavy and light
XX PT chain polypeptide, useful for diagnosing and treating e.g. inflammatory
XX PT disorders or cancer.
XX XX
XX PS Claim 1; Fig 1A; 25pp; English.
XX XX
XX CC The present sequence represents the heavy chain variable region of the
XX CC grafted monoclonal antibody LM609. LM609 is a murine antibody which
XX CC specifically recognises the integrin alphavbeta3, and inhibits its
XX CC functional activity. The LM609 grafted antibody has the
XX CC complementarity determining regions (CDRs) substituted into a non-murine
XX CC framework. Nucleic acids encoding LM609 grafted heavy and light chain
XX CC polypeptides and fragments are useful in diagnostic and therapeutic
XX CC purposes, such as in the production of LM609 grafted antibodies and
XX CC fragments having binding specificity and inhibitory activity against
XX CC the integrin alphavbeta3. The antibody can be used for the diagnosis
XX CC or treatment of alphavbeta3-mediated diseases (e.g. inflammatory
XX CC disorders, chronic articular rheumatism, psoriasis, disorders
XX CC associated with inappropriate or inopportune invasion of vessels such
XX CC as diabetic retinopathy, neovascular glaucoma and capillary
XX CC proliferation in atherosclerotic plaques, or cancers), and to inhibit
XX CC binding activity of alphavbeta3 that are necessary for progression of
XX CC an alphavbeta3-mediated disease.

XX Reducing immunogenicity of proteins - by modifying the amino acid
 PT sequence of the protein to eliminate potential epitopes for T-cells
 PT of a given species
 XX
 XX Example 5; Fig 25; 77pp; English.
 XX
 CC The invention relates to a method for the production of non-immunogenic
 CC proteins. The method comprises determining at least part of the amino
 CC acid sequence of the protein; (b) identifying in the amino acid sequence
 CC one or more potential epitopes for T-cells (T-cell epitopes) of the given
 CC species; and (c) modifying the amino acid sequence to eliminate at least
 CC one of the T-cell epitopes identified in step (b) thereby to eliminate or
 CC reduce the immunogenicity of the protein when exposed to the immune
 CC system of the given species. A method of analysing a pre-existing protein
 CC to predict the basis for immunogenic responses is also provided. The
 CC methods can be used particularly for reducing the immunogenicity of
 CC immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The
 CC products can be used for diagnosis and therapy. The present sequence
 CC represents the protein sequence of de-immunised humanised A33 Vh.

XX Improved method for antibody treatment - uses an antibody comprising
 PT an Old World monkey variable region and a human constant domain
 XX

PS Example 1; Fig 9c; 84pp; English.

XX This sequence represents the VH3 domain of an anti-CD4 antibody
 CC (Ab). This sequence can be used in the method of the invention for
 CC treating a subject, where the treatment comprises administration of an
 CC Ab. The method comprises the administration of an antibody which has an
 CC Old World monkey (e.g. baboon or macaque) variable region which binds to
 CC an antigen (Ag) (or Ag binding portion), and a human constant domain. The
 CC method is useful for the treatment of eczema and immuno-modulated
 CC diseases and especially rheumatoid arthritis. The recombinant antibodies
 CC used are sufficiently different from native monkey antibodies to allow
 CC human antigens to raise these antibodies, but similar enough to human
 CC antibody so there is no immune response to the antibodies in humans.
 CC Compared to antibodies used in therapy in prior art, these antibodies do
 CC not induce human anti-antibodies on repeated administration. They also
 CC have longer half-lives and do not have a lack of effector function with
 CC human cells.

 CC This invention describes novel antibodies that immunospecifically bind to
 CC B Lymphocyte Stimulator (Blys) polypeptides. Blys is a member of the
 CC tumour necrosis factor (TNF) super family and induces B cell
 CC proliferation and differentiation. The antibodies of the invention have
 CC cytostatic, immunosuppressive, immunostimulant, immunomodulatory,
 CC antirheumatic and antiAIDS activity and can be used in vaccines to
 CC inhibit the expression and activity of Blys. The antibodies bind to Blys
 CC and so may be used to detect and quantitate the presence of Blys in
 CC biological samples and may be used in this way to diagnose disease
 CC associated with aberrant expression of Blys. They may also be
 CC administered to treat diseases associated with aberrant Blys expression
 CC and activity such as cancer, immune, and autoimmune disorders and
 CC diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis,
 CC immunodeficiency (e.g. common variable immunodeficiency (CVID) and
 CC acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent
 CC the antibodies and fragments of the antibodies described in the method
 CC of the invention.

Chimeric monoclonal antibodies - contain anti-human fibrin

antibody light and heavy chain variable and constant for treating

thrombotic conditions e.g. myocardial infarction

Example; Figure 11; 87pp; English.

Plasmid pTB1373 contains the whole length of a mouse-human

chimeric anti-human fibrin heavy chain cDNA open reading

frame. It was prepd. using Poly(A)+ RNA from the anti-fibrin

chimeric Ab-producing transformant FIB1-HO1/X63 as a template

to clone human C-kappa cDNA, using the oligo-dT (Pharmacia) primer as

a primer for first strand cDNA synthesis and the 5'C2H and 3'EH

primers for the PCR. A human gamma-1 chain CH2-CH3 domain encoding

cDNA was amplified. Similarly a human gamma-1 chain CH1 domain

encoding cDNA and an anti-fibrin antibody VH cDNA and a leader

peptide cDNA were amplified using the primers 3'EH, 3'C2H and 3'ClH

respectively as a primer for first strand cDNA synthesis and the

primer combination of 5'ClH and 3'C2H, of 5'LIH and 3'CIH and of

5'SH and 3'LIH respectively as primers for PCR. The amplified gene

products were isolated and used to produce plasmids. After

confirmation of the cDNA sequence of each plasmid, the cDNA

encoding LH, VH, CH1 and CH2CH3 were joined together to give

plasmid pTB1373 contg. the whole length chimeric H chain

(LH, VH, CH1, CH2CH3), also abbreviated as IgH-FIB,

XX New human antibody specific for human interleukin-12 (IL-12) used to
XX treat disorders characterized by aberrant IL-12 expression e.g. Crohn's
XX disease and multiple sclerosis -
XX Claim 75; Page 121; 377pp; English.
XX This invention relates to a new human antibody specific for human
XX interleukin-12 (IL-12). The invention also includes antigen binding
XX portions that bind to IL-12. Sequences AAB39485-B39516 represent human
XX anti-IL-12 antibody heavy and light chain complementarity determining
XX region (CDR) amino acid sequences, and also includes variable region
XX amino acid sequences. Other variable region amino acid sequences are
XX given in AAB39517-B39560 and AAB40068-B40149. Sequences AAB39561-B39771
XX represent anti-IL-12 CDR3 related amino acid sequences, AAB39772-B40063
XX represent other CDR sequences. Light chain CDR3 consensus sequences are
XX given in AAB40064-B40067. Primers used in the identification and
XX construction of the antibodies of the invention are given in
XX AAC61062-C61071. The antibody of the invention is a neutralising
XX antibody and has antirheumatic; antiarthritic; antisclerotic;
XX antiinflammatory; neuroprotective; antipsoriatic; antiasthmatic;
XX cardiant; antiparasitic; antibacterial and immunosuppressive activity.
XX The antibodies or antigen-binding fragments are useful in the treatment
XX of disorders associated with detrimental release of human IL-12,
XX especially Crohn's disease, multiple sclerosis and rheumatoid arthritis.
XX They can also be used in the manufacture of a pharmaceutical composition
XX to treat human IL-12 disorders.

Listing first 45 summaries

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUMMARIES

CC -1- FUNCTION: Binding to cells via a high affinity receptor, laminin

CC is thought to mediate the attachment, migration, and organization

CC of cells into tissues during embryonic development by interacting

CC with other extracellular matrix components.

CC -1- SUBUNIT: Laminin is a complex glycoprotein, consisting of three

CC different polypeptide chains (alpha, beta, gamma), which are bound

CC to each other by disulfide bonds into a cross-shaped molecule

CC comprising one long and three short arms with globules at each

CC end.

CC THE ALPHA-2 CHAIN IS A SUBUNIT OF LAMININ-2 (MEROSIN) AND LAMININ-

CC 4 (S-MEROSIN).

CC -1- SUBCELLULAR LOCATION: Extracellular.

CC -1- TISSUE SPECIFICITY: FOUND IN THE BASEMENT MEMBRANES (MAJOR

CC COMPONENT).

CC -1- DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT

CC WITH OTHER LAMININ CHAINS TO FORM A COILED COIL STRUCTURE.

CC -1- DOMAIN: DOMAINS VI, IV AND G ARE GLOBULAR.

CC -1- DISEASE: DEFECTS IN LAMA2 ARE A CAUSE OF MURINE MUSCULAR DYSTROPHY

CC (DY2J).

CC -1- SIMILARITY: CONTAINS 1 LAMININ N-TERMINAL DOMAIN (DOMAIN VI).

CC -1- SIMILARITY: CONTAINS 17 LAMININ EGF-LIKE DOMAINS.

CC -1- SIMILARITY: CONTAINS 2 LAMININ DOMAINS IV.

CC -1- SIMILARITY: CONTAINS 5 LAMININ G-LIKE DOMAINS.

XX XX
XX PS Claim 1; Fig 1A; 25pp; English.
XX XX
XX CC The present sequence represents the heavy chain variable region of the
XX CC grafted monoclonal antibody LM609. LM609 is a murine antibody which
XX CC specifically recognises the integrin alphavbeta3, and inhibits its
XX CC functional activity. The LM609 grafted antibody has the
XX CC complementarity determining regions (CDRs) substituted into a non-murine
XX CC framework. Nucleic acids encoding LM609 grafted heavy and light chain
XX CC polypeptides and fragments are useful in diagnostic and therapeutic
XX CC purposes, such as in the production of LM609 grafted antibodies and
XX CC fragments having binding specificity and inhibitory activity against
XX CC the integrin alphavbeta3. The antibody can be used for the diagnosis
XX CC or treatment of alphavbeta3-mediated diseases (e.g. inflammatory
XX CC disorders, chronic articular rheumatism, psoriasis, disorders
XX CC associated with inappropriate or inopportune invasion of vessels such
XX CC as diabetic retinopathy, neovascular glaucoma and capillary
XX CC proliferation in atherosclerotic plaques, or cancers), and to inhibit
XX CC binding activity of alphavbeta3 that are necessary for progression of
XX CC an alphavbeta3-mediated disease.

XX Reducing immunogenicity of proteins - by modifying the amino acid
 PT sequence of the protein to eliminate potential epitopes for T-cells
 PT of a given species
 XX
 XX Example 6; Fig 27; 77pp; English.
 PS
 XX The invention relates to a method for the production of non-immunogenic
 CC proteins. The method comprises determining at least part of the amino
 CC acid sequence of the protein; (b) identifying in the amino acid sequence
 CC one or more potential epitopes for T-cells (T-cell epitopes) of the given
 CC species; and (c) modifying the amino acid sequence to eliminate at least
 CC one of the T-cell epitopes identified in step (b) thereby to eliminate or
 CC reduce the immunogenicity of the protein when exposed to the immune
 CC system of the given species. A method of analysing a pre-existing protein
 CC to predict the basis for immunogenic responses is also provided. The
 CC methods can be used particularly for reducing the immunogenicity of
 CC immunoglobulins or therapeutic proteins, e.g. streptokinase (SK). The
 CC products can be used for diagnosis and therapy. The present sequence
 CC represents the protein sequence of de-immunised murine A33 Vh.

XX Improved method for antibody treatment - uses an antibody comprising
 PT an Old World monkey variable region and a human constant domain
 PT
 XX Example 1; Fig 9c; 84pp; English.
 PS
 XX This sequence represents the VH3 domain of an anti-CD4 antibody
 CC (Ab). This sequence can be used in the method of the invention for
 CC treating a subject, where the treatment comprises administration of an
 CC Ab. The method comprises the administration of an antibody which has an
 CC Old World monkey (e.g. baboon or macaque) variable region which binds to
 CC an antigen (Ag) (or Ag binding portion), and a human constant domain. The
 CC method is useful for the treatment of eczema and immuno-modulated

CC diseases and especially rheumatoid arthritis. The recombinant antibodies
 CC used are sufficiently different from native monkey antibodies to allow
 CC human antigens to raise these antibodies, but similar enough to human
 CC antibody so there is no immune response to the antibodies in humans.
 CC Compared to antibodies used in therapy in prior art, these antibodies do
 CC not induce human anti-antibodies on repeated administration. They also
 CC have longer half-lives and do not have a lack of effector function with
 CC human cells.

XX Chimeric monoclonal antibodies - contain anti-human fibrin

PT antibody light and heavy chain variable and constant for treating

PT thrombotic conditions e.g. myocardial infarction

XX Example; Figure 4; 87pp; English.

PS PCR primers 5'mVH and 3'mVH were used to produce a VH gene-contg.
 CC fragment of about 330bp. The fragment was isolated and subcloned in
 CC pUC119. The fragment was found to be a functional VH structural
 CC gene, referred to as VFH, comprising a VH gene belonging to the
 CC subgroup III (VHIII) and the DSP2 and JH4 genes. Northern blot
 CC analysis using the whole RNA of FIBL-11 cells confirmed that VFH
 CC was the gene expressed in FIBL-11 cells. The sequence is given in
 CC AAQ25666.

XX Single polypeptide chain binding molecules - having light chain

PT variable region of antibody linked by peptide to heavy chain

PT variable region.

XX Disclosure; Fig 24; 68pp; English.

XX The sequence was constructed from the variable regions of a MAb

CC produced by the cell line 3C2, an IgG1 with a gamma 1 heavy chain
 CC and kappa light chain. The sequence encodes a single chain binding
 CC molecule comprising the variable regions of heavy and light chains
 CC linked by a peptides. The variable region of each DNA chain was
 CC prep'd. by introducing a ClaI site and an initiation codon (atcgatg)
 CC prior to the first codon of the mature sequence and a HindIII site
 CC and termination codon (taagctt) after codon 123 (heavy chain) or
 CC 109 (light chain). The plasmids constructed to contain these
 CC portions were pGX3772 and pGX3773 (heavy and light resp.). TRY40
 CC Met-[LCVR(1-41)]-I-A-K-A-F-K-N-[HCVR(8-115)]-P-G-S-[LCVR(45-109)].

 PT Single chain polypeptide for binding antigen - comprising light
 PT and heavy chain antigen binding portions linked by peptide linker
 XX
 XX Example 1; Figure 24; 78pp; English.
 PS
 XX The single chain polypeptide is derived from the mature light and
 CC heavy chains of a mouse monoclonal antibody (MAB) and has affinity
 CC for a given antigen (Bovine growth hormone). It comprises a first
 CC polypeptide comprising the antigen binding portion of of the light
 CC chain variable region of an antibody and a second polypeptide
 CC comprising the antigen binding portion of the heavy chain variable
 CC region of an antibody and at least one peptide linker linking the
 CC first and second polypeptide chains. The resulting single chain

CC polypeptide can be used in diagnostics, therapy
 CC (in vivo and in vitro), imaging, purifications and biosensors.
 CC This particular single chain binding molecule was designated TRY40
 CC and contains two linker peptides.

PT Immuno:purificn. using single binding chain molecule including
 PT antigen-binding parts of antibody light and heavy chain variable
 PT regions connected by a linker - is smaller, stabler and less

PT expensive than complete antibodies

XX Example 1; Fig 24; 78pp; English.

XX A novel single chain binding molecule (AAR99645), designated TRY40,

CC is a 2-linker construction incorporating VL and VH regions from

CC IgG1 anti-bovine growth hormone mouse IgG1 monoclonal antibody 3C2,

CC and peptide linkers from the Fv region of the IgA anti-phosphoryl

CC choline myeloma antibody MCPC-603. The single chain binding

CC molecule was expressed in E.coli transformants carrying pCX3776,

CC which incorporates encoding DNA (AAT13735), at a level of 7-2% of total

CC cell protein. Single chain binding molecules (see also AAR99646-51)

CC retain the binding specificity and affinity of the light and heavy

CC chain aggregate variable region of the native antibody but have the

CC advantages of smaller size, greater stability and reduced cost.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RT crenarchaeon, Aeropyrum pernix K1.";
RL DNA Res. 6:83-101(1999).
CC -|- CATALYTIC ACTIVITY: Chorismate + L-glutamine -> anthranilate +
CC pyruvate + L-glutamate.
CC -|- PATHWAY: Tryptophan biosynthesis: first step.
CC -|- SUBUNIT: Tetramer of two components I and two components II (by
CC similarity).
CC -|- MISCELLANEOUS: COMPONENT I CATALYZES THE FORMATION OF ANTHRANILATE
CC USING AMMONIA RATHER THAN GLUTAMINE, WHEREAS COMPONENT II PROVIDES
CC GLUTAMINE AMIDOTRANSFERASE ACTIVITY.
CC -|- SIMILARITY: BELONGS TO THE ANTHRANILATE SYNTHASE COMPONENT I
CC FAMILY.

XX Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
PS Claim 61; Page 41; 129pp; English.

XX AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX
XX Disclosure; Page 41; 132pp; English.
XX
XX The present invention relates to enhanced LM609 grafted antibodies
CC exhibiting selective binding affinity to alphaVbeta_3 integrin or
CC their functional fragments. The antibodies or their functional
CC fragments can be used in the diagnosis and treatment of
CC alphaVbeta_3-mediated diseases such as angiogenesis, inflammatory

CC diseases (such as psoriasis and chronic articular rheumatism),
CC disorders associated with inappropriate or inopportune invasion of
CC vessels (such as diabetic retinopathy, neovascular glaucoma and
CC cancer disorders such as tumours and Kaposi's sarcoma), retinal
CC diseases (such as macular degeneration), restenosis and
CC osteoporosis.

PS Claim 43; Fig 2a; 129pp; English.

XX This sequence represents the LM609 antibody variable heavy chain region. LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphavbeta3-mediated disease, specifically angiogenesis and restenosis (but also e.g. (non-)immune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Enhanced types of LM609 have affinity more than 90 times greater than that of parent the parent antibody.

XX PS Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine monoclonal antibody LM609. LM609 is directed to integrin alpha-v beta-3. It selectively promotes apoptosis of vascular cells that have been stimulated to undergo angiogenesis, making it a tool for cancer diagnosis and therapy. The invention provides humanised antibodies, especially humanised LM609. In such humanised antibodies, a light chain CDR from a mouse antibody such as LM609 is grafted onto a human light chain, and a heavy chain CDR from a mouse antibody is grafted onto a human antibody heavy chain to produce a library from which a humanised murine antibody having the desired specificity is selected. By preserving the original CDR sequences such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the humanisation strategy ensures epitope conservation.

XX New LM609 grafted antibody exhibiting selective binding affinity to alphavbeta3, comprising at least one LM609 grafted heavy and light chain polypeptide, useful for diagnosing and treating e.g. inflammatory disorders or cancer

XX
PS Claim 1; Fig 1A; 25pp; English.
CC
CC The present sequence represents the heavy chain variable region of the
CC grafted monoclonal antibody LM609. LM609 is a murine antibody which
CC specifically recognises the integrin alphavbeta3, and inhibits its
CC functional activity. The LM609 grafted antibody has the
CC complementarity determining regions (CDRs) substituted into a non-murine
CC framework. Nucleic acids encoding LM609 grafted heavy and light chain
CC polypeptides and fragments are useful in diagnostic and therapeutic
CC purposes, such as in the production of LM609 grafted antibodies and
CC fragments having binding specificity and inhibitory activity against
CC the integrin alphavbeta3. The antibody can be used for the diagnosis
CC or treatment of alphavbeta3-mediated diseases (e.g. inflammatory
CC disorders, chronic articular rheumatism, psoriasis, disorders
CC associated with inappropriate or inopportune invasion of vessels such
CC as diabetic retinopathy, neovascular glaucoma and capillary
CC proliferation in atherosclerotic plaques, or cancers), and to inhibit
CC binding activity of alphavbeta3 that are necessary for progression of
CC an alphavbeta3-mediated disease.

PT disorders or cancer
XX
XX Disclosure; Fig 2A; 25pp; English.
PS
XX The present sequence represents the heavy chain variable region of the
CC monoclonal antibody LM609. LM609 is a murine antibody which specifically

CC recognises the integrin alphavbeta3, and inhibits its functional activity.
CC The specification describes a LM609 grafted antibody which has the
CC complementarity determining regions (CDRs) substituted into a non-murine
CC framework. Nucleic acids encoding LM609 grafted heavy and light chain
CC polypeptides and fragments are useful in diagnostic and therapeutic
CC purposes, such as in the production of LM609 grafted antibodies and
CC fragments having binding specificity and inhibitory activity against
CC the integrin alphavbeta3. The antibody can be used for the diagnosis
CC or treatment of alphavbeta3-mediated diseases (e.g. inflammatory
CC disorders, chronic articular rheumatism, psoriasis, disorders
CC associated with inappropriate or inopportune invasion of vessels such
CC as diabetic retinopathy, neovascular glaucoma and capillary
CC proliferation in atherosclerotic plaques, or cancers), and to inhibit
CC binding activity of alphavbeta3 that are necessary for progression of
CC an alphavbeta3-mediated disease.

XX PT Nucleic acids encoding antibody binding sites of immunoglobulins
with affinity for cancer antigens useful in cancer therapy

XX PS Disclosure; Fig 1; 27pp; English.

XX CC This sequence is the antibody 15D3 VH chain. The invention relates
to isolated nucleic acid molecules comprising complementarity determining
regions (CDRs) and framework regions (FRs) from humans and mice encoding
a monomeric polypeptide that exhibits the immunological binding
properties of an immunoglobulin which binds to a human tumour cell
displaying the multiple drug resistance (MDR) phenotype. The recombinant
nucleotide sequences can be used to transfect mammalian cells for the
expression of recombinant human antibodies which exhibit the antigen
specificity of the murine antibody molecule. The polypeptides produced
can be used in specific binding assays, affinity purification schemes,
drug or toxin targeting, imaging and genetic or immunological
therapeutics for various cancers. The CDRs can be used in single chain Fv
(scFv) molecules which can be used in the development of retroviral
vectors that target human cancer cells expressing the MDR phenotype for
gene therapy. The recombinantly veneered murine antigen binding sites
consist of the selective replacement of FR residues from a rodent light
or heavy chain V region with human FR residues to provide a xenogeneic
molecule comprising an antigen binding site which retains substantially
all of the native FR polypeptide folding structure. The nucleic acids
encode molecules with altered or enhanced antigen-binding capabilities
and/or reduced immunogenicity.

 CC -1- FUNCTION: Extracellular matrix serine protease that plays a role
 CC in layering of neurons in the cerebral cortex and cerebellum.
 CC Regulates microtubule function in neurons and neuronal migration.
 CC Affects migration of sympathetic preganglionic neurons in the

spinal cord, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors VLDLR and ApoER2 induces tyrosine phosphorylation of Dab1 and modulation of Tau phosphorylation (By similarity).

-1- SUBUNIT: Binds to the ectodomains of VLDLR and ApoER2 (By similarity).

-1- SUBCELLULAR LOCATION: Secreted (By similarity).

-1- ALTERNATIVE PRODUCTS: 3 isoforms; 1 (shown here), 2 and 3; are produced by alternative splicing.

-1- TISSUE SPECIFICITY: Abundantly produced during brain ontogenesis by the Cajal-Retzius cells and other pioneer neurons located in the telencephalic marginal zone and by granule cells of the external granular layer of the cerebellum. In adult brain, preferentially expressed in GABAergic interneurons of prefrontal cortices, temporal cortex, hippocampus and glutamatergic granule cells of cerebellum. Also expressed in fetal and adult liver.

-1- DEVELOPMENTAL STAGE: Expressed in fetal and postnatal brain and liver. Expression in postnatal human brain is high in the cerebellum.

-1- DOMAIN: The basic C-terminal region is essential for secretion (By similarity).

-1- DISEASE: Defects in RELN are the cause of autosomal recessive lissencephaly with cerebellar hypoplasia (Also known as Norman-Roberts syndrome). Some patients also displayed persistent lymphedema neonatally, and one showed accumulation of chylous (i.e., fatty) ascites fluid.

-1- DISEASE: Defects in RELN may contribute to susceptibility to schizophrenia. Expression of the protein is reduced (about 50%) in patients with schizophrenia.

-1- DISEASE: Defects in RELN may predispose to autistic disorder. A polymorphic GGC triplet repeat located in the 5'UTR region of RELN (8 to 10 repeats) in the normal population is significantly increased in autistic patients (4 to 23 additional repeats).

-1- SIMILARITY: BELONGS TO THE REELIN FAMILY.

-1- SIMILARITY: CONTAINS 8 EGF-LIKE DOMAINS.

-1- SIMILARITY: CONTAINS 15 BNR REPEATS.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
PS Claim 61; Page 41; 129pp; English.
XX
CC AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX Humanized immunoglobulin for treating a CC-chemokine receptor
PT 2-mediated disorder in a patient, comprises a binding specificity for
PT CCR2, and a non-human antigen binding region and human immunoglobulin
PT -
XX Disclosure; Page 159; 183pp; English.
XX The patent discloses a humanised antibody or its antigen-binding
CC fragment, having binding specificity for CC-chemokine receptor 2
CC (CCR2), comprising an antigen binding region of non-human origin
CC and at least a portion of an immunoglobulin of human origin. The
CC humanised antibodies are useful for inhibiting the interaction of
CC a cell expressing CCR2. They are useful for inhibiting or treating
CC HIV infection. The proteins of the invention are useful for inhibiting
CC leukocyte trafficking, for treating CCR2-mediated disorders such as
CC inflammatory disorder, autoimmune disorders such as rheumatoid
CC arthritis and multiple sclerosis, atherogenesis and atherosclerosis,
CC and for inhibiting restenosis. They are useful in therapy or diagnosis,
CC and in the manufacture of a medicament for treating CCR2 mediated
CC disease. They are also useful for treating allergy, anaphylaxis,
CC malignancy, chronic and acute inflammation, histamine and IgE-
CC mediated allergic reaction, shock, stenosis, allograft rejection,
CC fibrotic disease, asthma, inflammatory glomerulopathies, acquired
CC immune deficiency syndrome (AIDS), restenosis associated with vascular
CC intervention, including angioplasty and/or stent placement in a mammal.
CC Humanised antibodies are also useful for inhibiting narrowing of the
CC lumen of a vessel in a mammal, and inhibiting neointimal hyperplasia of
CC a vessel in a mammal, preferably associated with vascular intervention.
CC The present sequence is mouse germline heavy chain variable (VH)
CC region, VH183.13.

XX Humanized immunoglobulin for treating a CC-chemokine receptor
PT 2-mediated disorder in a patient, comprises a binding specificity for
PT CCR2, and a non-human antigen binding region and human immunoglobulin
PT -
XX Disclosure; Page 154-155; 183pp; English.
XX The patent discloses a humanised antibody or its antigen-binding
CC fragment, having binding specificity for CC-chemokine receptor 2
CC (CCR2), comprising an antigen binding region of non-human origin
CC and at least a portion of an immunoglobulin of human origin. The
CC humanised antibodies are useful for inhibiting the interaction of
CC a cell expressing CCR2. They are useful for inhibiting or treating
CC HIV infection. The proteins of the invention are useful for inhibiting
CC leukocyte trafficking, for treating CCR2-mediated disorders such as
CC inflammatory disorder, autoimmune disorders such as rheumatoid
CC arthritis and multiple sclerosis, atherogenesis and atherosclerosis,
CC and for inhibiting restenosis. They are useful in therapy or diagnosis,
CC and in the manufacture of a medicament for treating CCR2 mediated
CC disease. They are also useful for treating allergy, anaphylaxis,
CC malignancy, chronic and acute inflammation, histamine and IgE-
CC mediated allergic reaction, shock, stenosis, allograft rejection,
CC fibrotic disease, asthma, inflammatory glomerulopathies, acquired
CC immune deficiency syndrome (AIDS), restenosis associated with vascular
CC intervention, including angioplasty and/or stent placement in a mammal.
CC Humanised antibodies are also useful for inhibiting narrowing of the
CC lumen of a vessel in a mammal, and inhibiting neointimal hyperplasia of
CC a vessel in a mammal, preferably associated with vascular intervention.
CC The present sequence is mouse germline heavy chain variable (VH)
CC region, V(H)50.1.

 XX New humanised antibody for the treatment of Alzheimer's comprises the
 PT inhibition and reduction of the formation of amyloid plaques -
 PT
 XX
 XX Claim 16; Page 15-16; 63pp; English.
 PS
 XX
 XX The invention relates a humanised antibody that specifically binds
 CC an epitope contained within positions 13-28 of amyloid beta peptide,
 CC Abeta. The antibody is useful to inhibit and reduce the formation of
 CC amyloid plaques or the effects of toxic soluble Abeta species in humans
 CC their fragments are used for the manufacture of a medicament. This includes
 CC the prolonged expression of recombinant sequences of them in human
 CC tissues for the treatment of clinical/pre-clinical Alzheimer's disease,
 CC Down's syndrome or pre clinical cerebral amyloid angiopathy.
 CC Specifically, the antibody is used to sequester Abeta into plasma, brain
 CC or cerebrospinal fluid to prevent/reverse accumulation of the Abeta
 CC peptide within the brain thereby improving cognition. The present
 CC sequence is a humanised heavy chain variable region originating
 CC from germline VH segment Dp53 and J segment JH4, with several amino
 CC acid substitutions to reduce antigenicity.

 XX Novel monoclonal antibody against human high-affinity IgE receptor -
 PT and DNA fragment encoding the MAb, for the specific identification
 PT of human Fc-epsilon RI
 PT
 XX Claim 3; Page 13; 20pp; Japanese.
 PS
 XX Polypeptides which specifically recognise human IgE receptor (Fc-
 CC epsilon-RI) have been isolated and sequenced. The new peptides are
 CC related to a monoclonal antibody against Fc-epsilon-RI and are
 CC either heavy or light chain molecules. The heavy chain molecules
 CC have the general formula FRI-CDR1H-FR2-CDR2H-FR3-CDR3H-FR4 (corresp.
 CC to AAR79155, AAR79157, AAR79159 and AAR79161) and are encoded
 CC by AAQ96280, AAQ96282, AAQ96284, AAQ96286 and AAQ96288. FRI is a
 CC polypeptide having 29-36 amino acids (aa), FR2 is a 10-16 aa polypeptide,
 CC FR3 is a 33-35 aa polypeptide and FR4 is a 12-14 aa polypeptide.
 CC Similarly the light chains have the general formula
 CC FR5-CDR1L-FR6-CDR2L-FR7-CDR3L-FR8, (corresp. to AAR79154, AAR79156,
 CC AAR79158, AAR79160 and AAR79162) and are encoded by AAQ96281, AAQ96283,
 CC AAQ96285, AAQ96287 and AAQ96289. FR5 is a 23-28 aa polypeptide, FR6 is a
 CC 14-16 aa polypeptide, FR7 is a 30-34 aa polypeptide and FR8 is a 9-11 aa
 CC polypeptide. All the peptides are derived from mouse hybridoma cells and
 CC are useful in the detection of the human Fc-epsilon-RI or for the
 CC elucidation of an antigen recognising region of a monoclonal antibody
 CC against human Fc-epsilon-RI.

Monoclonal antibody and its derivatives specific to high affinity
tyrosine kinase receptor of nerve growth factor useful for treating and
diagnosing neuropathological disorders such as pain, neuromas, TrkA
expressing neoplastic tumors

Claim 3; Page -: 33pp; English.

The invention relates to a murine monoclonal antibody, MNAC13, which
recognises the human nerve growth factor (NGF) receptor tyrosine
kinase, TrkA, and acts as an antagonist of NGF/TrkA binding. MNAC13
has a light chain variable region (VL) as given in AAB48936, and a heavy
chain variable region (VH) as given in AAB48937. The invention also
encompasses synthetic derivatives of monoclonal antibody MNAC13, such as
the single chain antibody, scFvMNAC13 (AAB48934), which comprises the
VL and VH regions of MNAC13 in one polypeptide chain. The invention
additionally relates to pharmaceutical compositions comprising the
antibody or antibody derivatives of the invention, engineered eukaryotic
cells able to express the MNAC13 antibody or its derivatives, and a
diagnostic composition comprising the antibody or its derivatives for in
vivo imaging. NGF antagonist (inhibitor of binding of NGF to TrkA
receptor The MNAC13 monoclonal antibody and its derivatives are useful
for treating neurological pathologies such as acute or chronic pain,

CC neuromas, and TrkA-expressing neoplastic tumours. A composition
CC comprising MNAC13 or its derivatives with a diagnostically acceptable
CC carrier is useful for in vivo imaging diagnostics. The present
CC murine monoclonal antibody MNAC13.
CC Note: The present sequence is derived from that of the single chain
CC antibody scFvMNAC13 shown on pages 32-33 and the information given in
CC claim 3.

XX Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX Claim 61; Page 41; 129pp; English.
XX
CC AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX
XX The present invention relates to enhanced LM609 grafted antibodies
CC exhibiting selective binding affinity to alphaVbeta_3 integrin or
CC their functional fragments. The antibodies or their functional
CC fragments can be used in the diagnosis and treatment of
CC alphaVbeta_3-mediated diseases such as angiogenesis, inflammatory

CC diseases (such as psoriasis and chronic articular rheumatism),
CC disorders associated with inappropriate or inopportune invasion of
CC vessels (such as diabetic retinopathy, neovascular glaucoma and
CC cancer disorders such as tumours and Kaposi's sarcoma), retinal
CC diseases (such as macular degeneration), restenosis and
CC osteoporosis.

PT Humanised antibody, Vitaxin, that binds selectively to alphaVbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
PS Claim 43; Fig 2a; 129pp; English.
XX
CC This sequence represents the LM609 antibody variable heavy chain region.
CC LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3
CC and can be used to inhibit binding of alphavbeta3 to a ligand and thus
CC block integrin-mediated signal transduction. This is useful in the
CC treatment, prevention and diagnosis of alphavbeta3-mediated disease,
CC specifically angiogenesis and restenosis (but also e.g. (non-)immune
CC inflammation, diabetic retinopathy, neovascular glaucoma, cancer,
CC psoriasis, rheumatoid arthritis, macular degeneration, osteoporosis
CC etc.). The antibodies contain non-murine framework regions so are
CC suitable for use in humans. Enhanced types of LM609 have affinity more
CC than 90 times greater than that of parent the parent antibody.

PS Disclosure; Page 52-53; 55pp; English.
XX
CC This sequence represents the heavy chain variable region of murine
CC monoclonal antibody LM609. LM609 is directed to integrin
CC alpha-v beta-3. It selectively promotes apoptosis of vascular

```

CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the
 CC humanisation strategy ensures epitope conservation.

XX New LM609 grafted antibody exhibiting selective binding affinity to
 PT alphavbeta3, comprising at least one LM609 grafted heavy and light
 PT chain polypeptide, useful for diagnosing and treating e.g. inflammatory
 PT disorders or cancer
 XX Claim 1; Fig 1A; 25pp; English.

XX The present sequence represents the heavy chain variable region of the
 CC grafted monoclonal antibody LM609. LM609 is a murine antibody which
 CC specifically recognises the integrin alphavbeta3, and inhibits is
 CC functional activity. The LM609 grafted antibody has the
 CC complementarity determining regions (CDRs) substituted into a non-murine
 CC framework. Nucleic acids encoding LM609 grafted heavy and light chain
 CC polypeptides and fragments are useful in diagnostic and therapeutic
 CC purposes, such as in the production of LM609 grafted antibodies and
 CC fragments having binding specificity and inhibitory activity against
 CC the integrin alphavbeta3. The antibody can be used for the diagnosis
 CC or treatment of alphavbeta3-mediated diseases (e.g. inflammatory

CC disorders, chronic articular rheumatism, psoriasis, disorders
 CC associated with inappropriate or inopportune invasion of vessels such
 CC as diabetic retinopathy, neovascular glaucoma and capillary
 CC proliferation in atherosclerotic plaques, or cancers), and to inhibit
 CC binding activity of alphavbeta3 that are necessary for progression of
 CC an alphavbeta3-mediated disease.

XX CC The invention describes a modified virus comprising non-native
CC polypeptides which has framework moieties each containing binding
CC moieties, where the virus has altered tropism conferred by the binding
CC moieties. The polypeptides can be expressed in the cytoplasm and nucleus
CC of mammalian host cell in conformation which is maintained in absence of
CC ligands for the binding moieties, where the conformation allows the
CC binding moiety subsequently to bind with the ligand. The modified virus
CC is useful in therapy for the preparation of a medicament for treating
CC tumour cells, cancer, proliferating cells, vascular diseases,
CC inflammatory diseases and infectious diseases such as Human
CC immunodeficiency virus (HIV). The altered tropisms allow the virus to be
CC used in treatment of disease in human or animal subjects, either by in
CC vivo treatment of, or ex vivo treatment of cells of, the subject
CC requiring treatment. The problems associated with the expression of
CC functional non-native viral components in the nucleus and cytosol of
CC host cells is solved by using the modified virus for the purpose. This
CC sequence represents an amino acid sequence used in the creation of the
CC modified virus containing non-native polypeptides.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal.
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX
PS Claim 62: Page 41; 129pp; English.
XX
CC AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX Production of humanized mouse monoclonal antibodies

XX Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine monoclonal antibody LM609. LM609 is directed to integrin alpha-v beta-3. It selectively promotes apoptosis of vascular cells that have been stimulated to undergo angiogenesis, making it a tool for cancer diagnosis and therapy. The invention provides humanised antibodies, especially humanised LM609. In such humanized antibodies, a light chain CDR from a mouse antibody such as LM609 is grafted onto a human light chain, and a heavy chain CDR from a mouse antibody is grafted onto a human antibody heavy chain to produce libraries from which a humanised murine antibody having the desired specificity is selected. By preserving the original CDR sequences such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the humanisation strategy ensures epitope conservation.

 XX New LM609 grafted antibody exhibiting selective binding affinity to
 PT alphavbeta3, comprising at least one LM609 grafted heavy and light
 PT chain polypeptide, useful for diagnosing and treating e.g. inflammatory
 PT disorders or cancer -
 XX Claim 1; Fig 1A; 25pp; English.

XX The present sequence represents the heavy chain variable region of the
 CC grafted monoclonal antibody LM609. LM609 is a murine antibody which
 CC specifically recognises the integrin alphavbeta3, and inhibits its
 CC functional activity. The LM609 grafted antibody has the
 CC complementarity determining regions (CDRs) substituted into a non-murine
 CC framework. Nucleic acids encoding LM609 grafted heavy and light chain
 CC polypeptides and fragments are useful in diagnostic and therapeutic
 CC purposes, such as in the production of LM609 grafted antibodies and
 CC fragments having binding specificity and inhibitory activity against
 CC the integrin alphavbeta3. The antibody can be used for the diagnosis
 CC or treatment of alphavbeta3-mediated diseases (e.g. inflammatory
 CC disorders, chronic articular rheumatism, psoriasis, disorders
 CC associated with inappropriate or inopportune invasion of vessels such
 CC as diabetic retinopathy, neovascular glaucoma and capillary
 CC proliferation in atherosclerotic plaques, or cancers), and to inhibit
 CC binding activity of alphavbeta3 that are necessary for progression of
 CC an alphavbeta3-mediated disease.

XX Enhanced LM609 grafted antibodies exhibiting selective binding affinity
PT to alpha(V)beta(3) integrin, useful in the diagnosis and treatment of
PT angiogenesis, inflammatory diseases e.g. psoriasis, cancers and
PT osteoporosis -

XX Disclosure; Fig 1; 132pp; English.

XX The present invention relates to enhanced LM609 grafted antibodies
CC exhibiting selective binding affinity to alphaVbeta_3 integrin or
CC their functional fragments. The antibodies or their functional
CC fragments can be used in the diagnosis and treatment of
CC alphavbeta_3-mediated diseases such as angiogenesis, inflammatory
CC diseases (such as psoriasis and chronic articular rheumatism),
CC disorders associated with inappropriate or inopportune invasion of
CC vessels (such as diabetic retinopathy, neovascular glaucoma and
CC cancer disorders such as tumours and Kaposi's sarcoma), retinal
CC diseases (such as macular degeneration), restenosis and
XX osteoporosis.

XX PS
XX CC This sequence represents the heavy chain variable region of a
XX CC humanised LM609 antibody. LM609 is directed to human integrin
XX CC alpha-v beta-3. It selectively promotes apoptosis of vascular
XX CC cells that have been stimulated to undergo angiogenesis, making it
XX CC a tool for cancer diagnosis and therapy. The invention provides
XX CC humanised antibodies, especially humanised LM609. In such humanized
XX CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
XX CC grafted onto a human light chain, and a heavy chain CDR from a mouse
XX CC antibody is grafted onto a human antibody heavy chain to produce
XX CC libraries from which a human antibody having the desired
XX CC specificity is selected. By preserving the original CDR sequences
XX CC such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the
XX CC humanisation strategy ensures epitope conservation.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT Integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX Claim 62; Page 41; 129pp; English.
XX
XX AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX
XX Enhanced LM609 grafted antibodies exhibiting selective binding affinity
PT to alpha(V)beta(3) integrin, useful in the diagnosis and treatment of
PT angiogenesis, inflammatory diseases e.g. psoriasis, cancers and
PT osteoporosis -
XX
XX Disclosure; Page 41; 132pp; English.
XX
XX The present invention relates to enhanced LM609 grafted antibodies
CC exhibiting selective binding affinity to alphavbeta_3 integrin or
CC their functional fragments. The antibodies or their functional
CC fragments can be used in the diagnosis and treatment of
CC alphavbeta_3-mediated diseases such as angiogenesis, inflammatory

CC diseases (such as psoriasis and chronic articular rheumatism),
CC disorders associated with inappropriate or inopportune invasion of
CC vessels (such as diabetic retinopathy, neovascular glaucoma and
CC cancer disorders such as tumours and Kaposi's sarcoma), retinal
CC diseases (such as macular degeneration), restenosis and
CC osteoporosis.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX Disclosure; Page 40; 129pp; English.
PS
XX
XX AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

 to alpha(V)beta(3) integrin, useful in the diagnosis and treatment of
 angiogenesis, inflammatory diseases e.g. psoriasis, cancers and
 osteoporosis -

PS Disclosure; Page 39; 132pp; English.

XX The present invention relates to enhanced LM609 grafted antibodies
 exhibiting selective binding affinity to alphaVbeta_3 integrin or
 their functional fragments. The antibodies or their functional
 fragments can be used in the diagnosis and treatment of
 alphaVbeta_3-mediated diseases such as angiogenesis, inflammatory
 diseases (such as psoriasis and chronic articular rheumatism),
 disorders associated with inappropriate or inopportune invasion of
 vessels (such as diabetic retinopathy, neovascular glaucoma and
 cancer disorders such as tumours and Kaposi's sarcoma), retinal
 diseases (such as macular degeneration), restenosis and
 osteoporosis.

XX PT Production of humanized mouse monoclonal antibodies
XX PS Disclosure; Page 51; 55pp; English.
XX CC This sequence represents the heavy chain variable region of a
XX CC humanised LM609 antibody. LM609 is directed to human integrin
XX CC alpha-v beta-3. It selectively promotes apoptosis of vascular
XX CC cells that have been stimulated to undergo angiogenesis, making it
XX CC a tool for cancer diagnosis and therapy. The invention provides
XX CC humanised antibodies, especially humanised LM609. In such humanized
XX CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
XX CC grafted onto a human light chain, and a heavy chain CDR from a mouse
XX CC antibody is grafted onto a human antibody heavy chain to produce
XX CC libraries from which a humanised murine antibody having the desired
XX CC specificity is selected. By preserving the original CDR sequences
XX CC such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the
XX CC humanisation strategy ensures epitope conservation.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX Claim 62; Page 41; 129pp; English.
XX
XX AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX
XX Enhanced LM609 grafted antibodies exhibiting selective binding affinity
PT to alpha(V)beta(3) integrin, useful in the diagnosis and treatment of
PT angiogenesis, inflammatory diseases e.g. psoriasis, cancers and
PT osteoporosis.
XX
XX Disclosure; Page 41; 132pp; English.
XX
XX The present invention relates to enhanced LM609 grafted antibodies
CC exhibiting selective binding affinity to alphavbeta3 integrin or
CC their functional fragments. The antibodies or their functional
CC fragments can be used in the diagnosis and treatment of
CC alphaVbeta3-mediated diseases such as angiogenesis, inflammatory

CC diseases (such as psoriasis and chronic articular rheumatism),
CC disorders associated with inappropriate or inopportune invasion of
CC vessels (such as diabetic retinopathy, neovascular glaucoma and
CC cancer disorders such as tumours and Kaposi's sarcoma), retinal
CC diseases (such as macular degeneration), restenosis and
CC osteoporosis.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX Disclosure; Page 40; 129pp; English.
XX
XX AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX Production of humanized mouse monoclonal antibodies

XX Disclosure; Page 52-53; 55pp; English.

XX This sequence represents the heavy chain variable region of murine
 CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanised
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the
 CC humanisation strategy ensures epitope conservation.

 PT chain polypeptide, useful for diagnosing and treating e.g. inflammatory
 PT disorders or cancer -
 XX Claim 1; Fig 1A; 25pp; English.

XX CC The present sequence represents the heavy chain variable region of the
 CC grafted monoclonal antibody LM609. LM609 is a murine antibody which
 CC specifically recognises the integrin alphavbeta3, and inhibits its
 CC functional activity. The LM609 grafted antibody has the
 CC complementary determining regions (CDRs) substituted into a non-murine
 CC framework. Nucleic acids encoding LM609 grafted heavy and light chain
 CC polypeptides and fragments are useful in diagnostic and therapeutic
 CC purposes, such as in the production of LM609 grafted antibodies and
 CC fragments having binding specificity and inhibitory activity against
 CC the integrin alphavbeta3. The antibody can be used for the diagnosis
 CC or treatment of alphavbeta3-mediated diseases (e.g. inflammatory
 CC disorders, chronic articular rheumatism, psoriasis, disorders
 CC associated with inappropriate or inopportune invasion of vessels such
 CC as diabetic retinopathy, neovascular glaucoma and capillary
 CC proliferation in atherosclerotic plaques, or cancers), and to inhibit
 CC binding activity of alphavbeta3 that are necessary for progression of
 CC an alphavbeta3-mediated disease.

XX CC alpha-v beta-3. It selectively promotes apoptosis of vascular
XX CC cells that have been stimulated to undergo angiogenesis, making it
XX CC a tool for cancer diagnosis and therapy. The invention provides
XX CC humanised antibodies, especially humanised LM609. In such humanized
XX CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
XX CC grafted onto a human light chain, and a heavy chain CDR from a mouse
XX CC antibody is grafted onto a human antibody heavy chain to produce
XX CC libraries from which a humanised murine antibody having the desired
XX CC specificity is selected. By preserving the original CDR sequences
XX CC such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the
XX CC humanisation strategy ensures epitope conservation.

XX
XX This sequence represents the heavy chain variable region of a
CC humanised LM609 antibody. LM609 is directed to human integrin
CC alpha-v beta-3. It selectively promotes apoptosis of vascular
CC cells that have been stimulated to undergo angiogenesis, making it
CC a tool for cancer diagnosis and therapy. The invention provides
CC humanised antibodies, especially humanised LM609. In such humanized
CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
CC grafted onto a human light chain, and a heavy chain CDR from a mouse
CC antibody is grafted onto a human antibody heavy chain to produce
CC libraries from which a humanised murine antibody having the desired
CC specificity is selected. By preserving the original CDR sequences
CC such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the
CC humanisation strategy ensures epitope conservation.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX Claim 62; Page 41; 129pp; English.
XX
CC AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX Enhanced LM609 grafted antibodies exhibiting selective binding affinity
PT to alpha(V)beta(3) integrin, useful in the diagnosis and treatment of
PT angiogenesis, inflammatory diseases e.g. psoriasis, cancers and
PT osteoporosis -
XX
XX Disclosure; Page 41; 132pp; English.
XX
CC The present invention relates to enhanced LM609 grafted antibodies
CC exhibiting selective binding affinity to alphavbeta_3 integrin or
CC their functional fragments. The antibodies or their functional
CC fragments can be used in the diagnosis and treatment of
CC alphavbeta_3-mediated diseases such as angiogenesis, inflammatory

CC diseases (such as psoriasis and chronic articular rheumatism),
CC disorders associated with inappropriate or inopportune invasion of
CC vessels (such as diabetic retinopathy, neovascular glaucoma and
CC cancer disorders such as tumours and Kaposi's sarcoma), retinal
CC diseases (such as macular degeneration), restenosis and
CC osteoporosis.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
XX Claim 62; Page 43; 129pp; English.
XX
XX AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

 XX Disclosure; Page 52-53; 55pp; English.
 PS This sequence represents the heavy chain variable region of murine
 CC monoclonal antibody LM609. LM609 is directed to integrin
 CC alpha-v beta-3. It selectively promotes apoptosis of vascular
 CC cells that have been stimulated to undergo angiogenesis, making it
 CC a tool for cancer diagnosis and therapy. The invention provides
 CC humanised antibodies, especially humanised LM609. In such humanized
 CC antibodies, a light chain CDR from a mouse antibody such as LM609 is
 CC grafted onto a human light chain, and a heavy chain CDR from a mouse
 CC antibody is grafted onto a human antibody heavy chain to produce
 CC libraries from which a humanised murine antibody having the desired
 CC specificity is selected. By preserving the original CDR sequences
 CC such as the HCDR3 and LCDR3 sequences of LM609 (see AAY06371-72), the
 CC humanisation strategy ensures epitope conservation.

 PT disorders or cancer.

XX Claim 1; Fig 1A; 25pp; English.

XX The present sequence represents the heavy chain variable region of the
 CC grafted monoclonal antibody LM609. LM609 is a murine antibody which
 CC specifically recognises the integrin alphavbeta3, and inhibits its
 CC functional activity. The LM609 grafted antibody has the
 CC complementarity determining regions (CDRs) substituted into a non-murine
 CC framework. Nucleic acids encoding LM609 grafted heavy and light chain
 CC polypeptides and fragments are useful in diagnostic and therapeutic
 CC purposes, such as in the production of LM609 grafted antibodies and
 CC fragments having binding specificity and inhibitory activity against
 CC the integrin alphavbeta3. The antibody can be used for the diagnosis
 CC or treatment of alphavbeta3-mediated diseases (e.g. inflammatory
 CC disorders, chronic articular rheumatism, psoriasis, disorders
 CC associated with inappropriate or inopportune invasion of vessels such
 CC as diabetic retinopathy, neovascular glaucoma and capillary
 CC proliferation in atherosclerotic plaques, or cancers), and to inhibit
 CC binding activity of alphavbeta3 that are necessary for progression of
 CC an alphavbeta3-mediated disease.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
PS Claim 62; Page 41; 129pp; English.
XX
CC AAW76007-W76040 are protein fragments of the grafted monoclonal antibody
CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.

XX
XX The present invention relates to enhanced LM609 grafted antibodies
CC exhibiting selective binding affinity to alphavbeta_3 integrin or
CC their functional fragments. The antibodies or their functional
CC fragments can be used in the diagnosis and treatment of
CC alphavbeta_3-mediated diseases such as angiogenesis, inflammatory

CC diseases (such as psoriasis and chronic articular rheumatism),
CC disorders associated with inappropriate or inopportune invasion of
CC vessels (such as diabetic retinopathy, neovascular glaucoma and
CC cancer disorders such as tumours and Kaposi's sarcoma), retinal
CC diseases (such as macular degeneration), restenosis and
CC osteoporosis.

XX Humanised antibody, Vitaxin, that binds selectively to alphavbeta3
PT integrin - and related grafted antibodies based on murine monoclonal
PT LM609, also related nucleic acid, used to treat, prevent or diagnose
PT angiogenesis or restenosis
XX
PS Claim 62; Page 41; 129pp; English.
XX
CC AAW76007-W76040 are protein fragments of the grafted monoclonal antibody

CC LM609 heavy and light chain variable region. LM609 and the antibody
CC vitaxin bind selectively to integrin alphavbeta3 and can be used to
CC inhibit binding of alphavbeta3 to a ligand and thus block
CC integrin-mediated signal transduction. This is useful in the treatment,
CC prevention and diagnosis of alphavbeta3-mediated disease, specifically
CC angiogenesis and restenosis (but also e.g. (non-)immune inflammation,
CC diabetic retinopathy, neovascular glaucoma, cancer, psoriasis,
CC rheumatoid arthritis, macular degeneration, osteoporosis etc.). The
CC antibodies contain non-murine framework regions so are suitable for use
CC in humans. Enhanced types of LM609 have affinity more than 90 times
CC greater than that of parent the parent antibody.
